Topic 8

Black Box Testing

Black Box Testing

- Black-box testing, also called behavioral testing, focuses on the functional requirements of the software
- Different techniques
 - Graph-Based Testing Methods
 - Data Coverage Analysis
 - Boundary Value Analysis

Data Coverage Analysis

Create columns to use in the data coverage analysis

Create columns that map to source data columns to use in the analysis. You can create columns that use source data as is or in ranges of data values. You can also create columns that map data values across specific groups of values.

 Run the data coverage task and view the results of the analysis on the data coverage page

You can run the data coverage task and view the results in the data coverage page. You can edit the results view to select and view specific cells in the results.

Edit the parameters used in the analysis

You can edit the parameters including the columns and filters applied and view updated analysis results in the data coverage page.

Update data values in the source data

You can update data values across cells that you analyze. For example, based on the data coverage analysis results, a cell contains data values below the minimum threshold that you set. You can update data in other cells to create the minimum required data values in the cell.

Decision Table

- Decision table is a useful method to represent the information in a tabular method. It has the specialty to consider complex combinations of input conditions and resulting actions.
- Decision tables obtain their power from logical expressions. Each operand or variable in a logical expression takes on the value, TRUE or FALSE.

Formation Of Decision Table

ENTRY

| _ | | Rule 1 | Rule 2 | Rule 3 | Rule 4 | |
|-----------|----|--------|--------|--------|--------|--|
| Condition | C1 | True | True | False | I | |
| Sto | C2 | False | True | False | True | |
| 0 | C3 | True | True | True | - 1 | |
| _ | A1 | | Χ | | | |
| Action | A2 | Χ | | | Χ | |
| ₹ ° | АЗ | | | Χ | | |

Decision table structure

Decision Table Structure

Condition Stub

It is a list of input conditions for which the complex combination is made.

Action Stub

 It is a list of resulting actions which will be performed if a combination of input condition is satisfied.

Condition Entry

- It is a specific entry in the table corresponding to input conditions mentioned in the condition stub. When we enter TRUE or FALSE for all input conditions for a particular combination, then it is called a Rule.
- When the condition entry takes only two values—TRUE or FALSE, then it is called Limited Entry Decision Table.

Decision Table Structure

- When the condition entry takes several values, then it is called Extended Entry Decision Table.
- In limited entry decision table, condition entry, which has no effect whether it is True or False, is called a Don't-Care state or immaterial state.

Action Entry

• It is the entry in the table for the resulting action to be performed when one rule (which is a combination of input condition) is satisfied. 'X' denotes the action entry in the table.

Test Case Design Using Decision Table

- For designing test cases from a decision table, following interpretations should be done:
 - Interpret condition stubs as the inputs for the test case.
 - Interpret action stubs as the expected output for the test case.
 - Rule, which is the combination of input conditions, becomes the test case itself.
 - If there are **k** rules over n binary conditions, there are at least **k** test cases and at the most **2**ⁿ test cases.

Example

A program calculates the total salary of an employee with the conditions that if the working hours are less than or equal to 48, then give normal salary. The hours over 48 on normal working days are calculated at the rate of 1.25 of the salary. However, on holidays or Sundays, the hours are calculated at the rate of 2.00 times of the salary. Design test cases using decision table testing.

• The decision table for the program is shown below:

ENTRY

| | | Rule 1 | Rule 2 | Rule3 |
|----------------|-------------------------|--------|--------|-------|
| Condition Stub | C1: Working hours > 48 | I | F | Т |
| | C2: Holidays or Sundays | Т | F | F |
| Action Stub | A1: Normal salary | | Х | |
| | A2: 1.25 of salary | | | X |
| | A3: 2.00 of salary | X | | |

The test cases derived from the decision table are given below:

| Test Case ID | Working Hour | Day | Expected Result |
|--------------|--------------|---------|-----------------|
| 1 | 48 | Monday | Normal Salary |
| 2 | 50 | Tuesday | 1.25 of salary |
| 3 | 52 | Sunday | 2.00 of salary |

Example 2

A wholesaler has three commodities to sell and has three types of customers. Discount is given as per the following procedure:

- (i) For DGS & D orders, 10% discount is given irrespective of the value of the order.
- (ii) For orders of more than Rs 50,000, agents get a discount of 15% and the retailer gets a discount of 10%.
- (iii) For orders of Rs 20,000 or more and up to Rs 50,000, agents get 12% and the retailer gets 8% discount.
- (iv) For orders of less than Rs 20,000, agents get 8% and the retailer gets 5% discount.

The above rules do not apply to the furniture items wherein a flat rate of 10% discount is admissible to all customers irrespective of the value of the order.

Design test cases for this system using decision table testing.

ENTRY

| | | R1 | R2 | R3 | R4 | R5 | R6 | R7 | R8 |
|----------------|-------------------------------|-----|----|----|----|----|----|----|----|
| | C1: DGS & D | Т | F | F | F | F | F | F | I |
| 욕 | C2: Agent | F | Т | F | Т | F | Т | F | -1 |
| n Stu | C3: Retailer | F | F | Т | F | Т | F | Т | I |
| Condition Stub | C4: Order > 50,000 | - 1 | Т | Т | F | F | F | F | -1 |
| Con | C5: Order ≥ 20000 to < 50,000 | I | F | F | Т | Т | F | F | ı |
| | C6: Order < 20,000 | - 1 | F | F | F | F | Т | Т | -1 |
| | C7: Furniture | F | F | F | F | F | F | F | Т |
| | A1: Discount of 5% | | | | | | | Χ | |
| Stub | A2: Discount of 8% | | | | | Χ | Χ | | |
| Action Stub | A3: Discount of 10% | Х | | Х | | | | | Х |
| Act | A4: Discount of 12% | | | | Χ | | | | |
| | A5: Discount of 15% | | Χ | | | | | | |

The test cases derived from the decision table are given below:

| Test Case ID | Type of Customer | Product Furniture? | Order Value (Rs) | Expected Result |
|--------------|------------------|--------------------|------------------|-----------------|
| 1 | DGS & D | No | 51,000 | 10% Discount |
| 2 | Agent | No | 52,000 | 15% Discount |
| 3 | Retailer | No | 53,000 | 10% Discount |
| 4 | Agent | No | 23,000 | 12% Discount |
| 5 | Retailer | No | 27,000 | 8% Discount |
| 6 | Agent | No | 15,000 | 8% Discount |
| 7 | Retailer | No | 18,000 | 5% Discount |
| 8 | Agent | Yes | 34,000 | 10% Discount |

Example 3

A university is admitting students in a professional course subject to the following conditions:

- (a) Marks in Java ≥ 70
- (b) Marks in C++ \geq 60
- (c) Marks in OOAD ≥ 60
- (d) Total in all three subjects ≥ 220 OR Total in Java and C++ ≥ 150

If the aggregate mark of an eligible candidate is more than 240, he will be eligible for scholarship course, otherwise he will be eligible for normal course. The program reads the marks in the three subjects and generates the following outputs:

- (i) Not eligible
- (ii) Eligible for scholarship course
- (iii) Eligible for normal course

Design test cases for this program using decision table testing.

ENTRY

| | R1 | R2 | R3 | R4 | R5 | R6 | R7 | R8 |
|-------------------------------------|----|----|----|-----|----|----|----|----|
| C1: marks in Java ≥ 70 | Т | Т | Т | F | ı | - | - | Т |
| C2: marks in C++ ≥ 60 | Т | Т | Т | - 1 | F | 1 | 1 | Т |
| C3: marks in OOAD ≥ 60 | Т | Т | Т | - 1 | ı | F | 1 | Т |
| C4:Total in three subjects ≥ 220 | Т | F | Т | -1 | -1 | -1 | F | Т |
| C5:Total in Java & C++ ≥ 150 | F | Т | 1 | - 1 | ı | -1 | F | Т |
| C6:Aggregate marks > 240 | F | F | Т | -1 | -1 | -1 | -1 | F |
| A1: Eligible for normal course | Χ | Χ | | | | | | Χ |
| A2: Eligible for scholarship course | | | Χ | | | | | |
| A3: Not eligible | | | | Χ | Χ | Χ | Χ | |

The test cases derived from the decision table are given below:

| Test Case ID | Java | C++ | OOAD | Aggregate Marks | Expected Output |
|--------------|------|-----|------|-----------------|---------------------------------|
| 1 | 75 | 75 | 70 | 220 | Eligible for normal course |
| 2 | 75 | 75 | 60 | 210 | Eligible for normal course |
| 3 | 75 | 74 | 93 | 242 | Eligible for scholarship course |
| 4 | 78 | 45 | 78 | 201 | Not eligible |
| 5 | 68 | 78 | 80 | 226 | Not eligible |
| 6 | 70 | 72 | 70 | 212 | Not eligible |
| 7 | 80 | 80 | 50 | 210 | Not eligible |
| 8 | 75 | 75 | 75 | 225 | Eligible for normal course |

Example 4 (Immaterial Cases)

 Consider Example 1 once again whose decision table is shown below with immaterial cases.

ENTRY

| | | Rule 1 | Rule 2 | Rule 3 |
|----------------|-------------------------|--------|--------|--------|
| Condition Stub | C1: Working hours > 48 | I | F | Т |
| Condition Stub | C2: Holidays or Sundays | T | F | F |
| | A1: Normal salary | | Χ | |
| Action Stub | A2: 1.25 of salary | | | X |
| | A3: 2.00 of salary | Χ | | |

 The immaterial test case in Rule 1 of the above table can be expanded by taking both T and F values of C1. The expanded decision table is shown below:

ENTRY

| | | Rule 1-1 | Rule 1-2 | Rule 2 | Rule 3 |
|----------------|-------------------------|-----------------|----------|--------|--------|
| | C1: Working hours > 48 | F | Т | F | Т |
| Condition Stub | C2: Holidays or Sundays | Т | Т | F | F |
| | A1: Normal salary | | | Χ | |
| Action Stub | A2: 1.25 of salary | | | | Χ |
| | A3: 2.00 of salary | Χ | Χ | | |

The test cases derived from the decision table are given below:

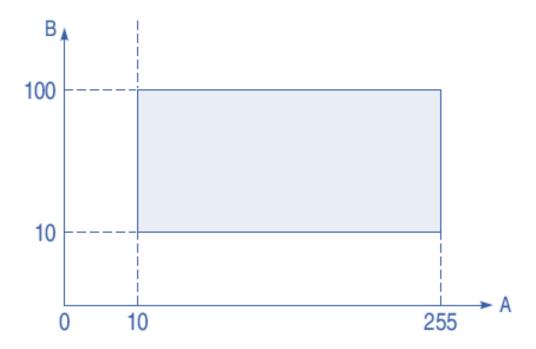

| Test Case ID | Working Hour | Day | Expected Result |
|--------------|--------------|---------|-----------------|
| 1 | 48 | Monday | Normal salary |
| 2 | 50 | Tuesday | 1.25 of salary |
| 3 | 52 | Sunday | 2.00 of salary |
| 4 | 30 | Sunday | 2.00 of salary |

Boundary Value Analysis (BVA)

- It is considered a technique that uncovers the bugs at the boundary of input values. Here, boundary means the maximum or minimum value taken by the input domain.
- It is an effective test case design that requires test cases to be designed such that they maximize the probability of finding errors.
- With the experience of testing team, it has been observed that test cases
 designed with boundary input values have a high chance to find errors. It means
 that most of the failures crop up due to boundary values.

BVA: Example

If A is an integer between 10 and 255, then boundary checking can be on 10(9,10,11) and on 255(256,255,254). Similarly, B is another integer variable between 10 and 100, then boundary checking can be on 10(9,10,11) and 100(99,100,101)

Boundary Value Checking (BVC)

- In this method, the test cases are designed by holding one variable at its extreme value and other variables at their nominal values in the input domain.
- The variable at its extreme value can be selected at:
 - Minimum value (Min)
 - Value just above the minimum value (Min+)
 - Maximum value (Max)
 - Value just below the maximum value (Max-)

BVC: Example

Let us take the example of two variables, A and B. If we consider all the above combinations with nominal values, then following test cases can be designed:

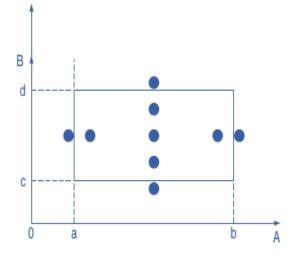

2.
$$A_{nom}$$
, B_{min+}

3.
$$A_{nom}$$
, B_{max}

3.
$$A_{nom}$$
, B_{max} 4. A_{nom} , B_{max-}

5.
$$A_{min}$$
, B_{nom} 6. A_{min+} , B_{nom}

7.
$$A_{max}$$
, B_{nom}

It can be generalized that for n variables in a module, 4n + 1 test cases can be designed with boundary value checking method.

Robustness Testing Method

- The idea of BVC can be extended such that boundary values are exceeded as:
 - A value just greater than the Maximum value (Max+)
 - A value just less than Minimum value (Min–)
- When test cases are designed considering the above points in addition to BVC, it is called robustness testing.

Robustness Testing Method: Example

• Let us take the previous example again. Add the following test cases to the list of 9 test cases designed in BVC:

• It can be generalized that for **n** input variables in a module, **6n + 1** test cases an be designed with robustness testing.

Worst-case Testing Method

- We can again extend the concept of BVC by assuming more than one variable on the boundary. It is called worst-case testing method.
- following test cases to the list of 9 test cases designed in BVC as:

• It can be generalized that for n input variables in a module, 5ⁿ test cases can be designed with worst-case testing.

Example 1

A program reads an integer number within the range [1,100] and determines whether it is a prime number or not. Design test cases for this program using **BVC**, **robust testing**, and **worst-case testing** methods.

• **Test cases using BVC:** Since there is one variable, the total number of test cases will be 4n + 1 = 5. In our example, the set of minimum and maximum values is shown below:

Min value = 1

Min+ value = 2

Max value = 100

Max- value = 99

Nominal value = 50-55

Using these values, test cases can be designed as shown below:

| Test Case ID | Integer Variable | Expected Output |
|--------------|------------------|--------------------|
| 1 | 1 | Not a prime number |
| 2 | 2 | Prime number |
| 3 | 100 | Not a prime number |
| 4 | 99 | Not a prime number |
| 5 | 53 | Prime number |

• **Test cases using robust testing:** Since there is one variable, the total number of test cases will be 6n + 1 = 7. The set of boundary values is shown below:

Min value = 1

Min value = 0

Min value = 2

Max value = 100

Max value = 99

Max value = 101

Nominal value = 50-55

Using these values, test cases can be designed as shown below:

| Test Case ID | Integer Variable | Expected Output |
|--------------|------------------|--------------------|
| 1 | 0 | Invalid input |
| 2 | 1 | Not a prime number |
| 3 | 2 | Prime number |
| 4 | 100 | Not a prime number |
| 5 | 99 | Not a prime number |
| 6 | 101 | Invalid input |
| 7 | 53 | Prime number |

• Test cases using worst-case testing: Since there is one variable, the total number of test cases will be $5^n = 5$. Therefore, the number of test cases will be same as BVC.

Example 2

A program computes **a**^b where a lies in the range [1,10] and b within [1,5]. Design test cases for this program using **BVC**, **robust testing**, **and worst-case** testing methods.

Test cases using BVC:

Since there are two variables, a and b, the total number of test cases will be 4n + 1 = 9. The set of boundary values is shown below:

| | a | b |
|------------------------|----|---|
| Min value | 1 | 1 |
| Min+ value | 2 | 2 |
| Max value | 10 | 5 |
| Max ⁻ value | 9 | 4 |
| Nominal value | 5 | 3 |

Using these values, test cases can be designed as shown below:

| Test Case ID | a | b | Expected Output |
|--------------|----|---|-----------------|
| 1 | 1 | 3 | 1 |
| 2 | 2 | 3 | 8 |
| 3 | 10 | 3 | 1000 |
| 4 | 9 | 3 | 729 |
| 5 | 5 | 1 | 5 |
| 6 | 5 | 2 | 25 |
| 7 | 5 | 4 | 625 |
| 8 | 5 | 5 | 3125 |
| 9 | 5 | 3 | 125 |

• **Test cases using robust testing**: Since there are two variables, a and b, the total number of test cases will be 6n + 1 = 13. The set of boundary values is shown below:

| | а | b |
|------------------------|----|---|
| Min value | 1 | 1 |
| Min ⁻ value | 0 | 0 |
| Min⁺ value | 2 | 2 |
| Max value | 10 | 5 |
| Max ⁺ value | 11 | 6 |
| Max ⁻ value | 9 | 4 |
| Nominal value | 5 | 3 |

Using these values, test cases can be designed as shown:

| Test Case ID | а | b | Expected output |
|--------------|----|---|-----------------|
| 1 | 0 | 3 | Invalid input |
| 2 | 1 | 3 | 1 |
| 3 | 2 | 3 | 8 |
| 4 | 10 | 3 | 1000 |
| 5 | 11 | 3 | Invalid input |
| 6 | 9 | 3 | 729 |
| 7 | 5 | 0 | Invalid input |
| 8 | 5 | 1 | 5 |
| 9 | 5 | 2 | 25 |
| 10 | 5 | 4 | 625 |
| 11 | 5 | 5 | 3125 |
| 12 | 5 | 6 | Invalid input |
| 13 | 5 | 3 | 125 |

• Test cases using worst-case testing: Since there are two variables, a and b, the total number of test cases will be $5^n = 25$.

| | а | b |
|------------------------|----|---|
| Min value | 1 | 1 |
| Min+ value | 2 | 2 |
| Max value | 10 | 5 |
| Max ⁻ value | 9 | 4 |
| Nominal value | 5 | 3 |

Using these values, test cases can be designed as shown:

| Test Case ID | а | b | Expected Output |
|--------------|----|---|-----------------|
| 1 | 1 | 1 | 1 |
| 2 | 1 | 2 | 1 |
| 3 | 1 | 3 | 1 |
| 4 | 1 | 4 | 1 |
| 5 | 1 | 5 | 1 |
| 6 | 2 | 1 | 2 |
| 7 | 2 | 2 | 4 |
| 8 | 2 | 3 | 8 |
| 9 | 2 | 4 | 16 |
| 10 | 2 | 5 | 32 |
| 11 | 5 | 1 | 5 |
| 12 | 5 | 2 | 25 |
| 13 | 5 | 3 | 125 |
| 14 | 5 | 4 | 625 |
| 15 | 5 | 5 | 3125 |
| 16 | 9 | 1 | 9 |
| 17 | 9 | 2 | 81 |
| 18 | 9 | 3 | 729 |
| 19 | 9 | 4 | 6561 |
| 20 | 9 | 5 | 59049 |
| 21 | 10 | 1 | 10 |
| 22 | 10 | 2 | 100 |
| 23 | 10 | 3 | 1000 |
| 24 | 10 | 4 | 10000 |
| 25 | 10 | 5 | 100000 |

Example 3

A program reads three numbers, A, B, and C, within the range [1, 50] and prints the largest number. Design test cases for this program using BVC, robust testing, and worst-case testing methods.

Test cases using BVC:

Since there is one variable, the total number of test cases will be 4n + 1 = 5. In our example, the set of minimum and maximum values is

shown below:

Min value = 1

 Min^+ value = 2

Max value = 50

 Max^- value = 49

Nominal value = 25-30

Using these values, test cases can be designed as shown below:

| Test Case ID | Α | В | С | Expected Output |
|--------------|----|----|----|-----------------|
| 1 | 1 | 25 | 27 | C is largest |
| 2 | 2 | 25 | 28 | C is largest |
| 3 | 49 | 25 | 25 | A is largest |
| 4 | 50 | 25 | 29 | A is largest |
| 5 | 25 | 1 | 30 | C is largest |
| 6 | 25 | 2 | 26 | C is largest |
| 7 | 25 | 49 | 27 | B is largest |
| 8 | 25 | 50 | 28 | B is largest |
| 9 | 25 | 28 | 1 | B is largest |
| 10 | 25 | 27 | 2 | B is largest |
| 11 | 25 | 26 | 49 | C is largest |
| 12 | 25 | 26 | 50 | C is largest |
| 13 | 25 | 25 | 25 | Three are equal |

• Test cases robust testing: Since there are three variables, A, B, and C, the total number of test cases will be 6n + 1 = 19.

| Min value = 1 |
|-----------------------------|
| Min ⁻ value = 0 |
| Min ⁺ value = 2 |
| Max value = 50 |
| Max ⁺ value = 51 |
| Max ⁻ value = 49 |
| Nominal value = 25–30 |

Using these values, test cases can be designed as shown:

| Test Case ID | Α | В | С | Expected Output |
|--------------|----|----|----|-----------------|
| 1 | 0 | 25 | 27 | Invalid input |
| 2 | 1 | 25 | 27 | C is largest |
| 3 | 2 | 25 | 28 | C is largest |
| 4 | 49 | 25 | 25 | A is largest |
| 5 | 50 | 25 | 29 | A is largest |
| 6 | 51 | 27 | 25 | Invalid input |
| 7 | 25 | 0 | 26 | Invalid input |
| 8 | 25 | 1 | 30 | C is largest |
| 9 | 25 | 2 | 26 | C is largest |
| 10 | 25 | 49 | 27 | B is largest |
| 11 | 25 | 50 | 28 | B is largest |
| 12 | 26 | 51 | 25 | Invalid input |
| 13 | 25 | 25 | 0 | Invalid input |
| 14 | 25 | 28 | 1 | B is largest |
| 15 | 25 | 27 | 2 | B is largest |
| 16 | 25 | 26 | 49 | C is largest |
| 17 | 25 | 26 | 50 | C is largest |
| 18 | 25 | 29 | 51 | Invalid input |
| 19 | 25 | 25 | 25 | Three are equal |

• Test cases worst-case testing: Since there are three variables, A, B, and C, the total number of test cases will be $5^n = 125$.

Min value = 1

Min+ value = 2

Max value = 50

Max- value = 49

Nominal value = 25–30

Using these values, test cases can be designed as shown below:

| Test Case ID | Α | В | С | Expected Output |
|--------------|---|----|----|---------------------|
| 1 | 1 | 1 | 1 | All three are equal |
| 2 | 1 | 1 | 2 | C is greatest |
| 3 | 1 | 1 | 25 | C is greatest |
| 4 | 1 | 1 | 49 | C is greatest |
| 5 | 1 | 1 | 50 | C is greatest |
| 6 | 1 | 2 | 1 | B is greatest |
| 7 | 1 | 2 | 2 | B and C |
| 8 | 1 | 2 | 25 | C is greatest |
| 9 | 1 | 2 | 49 | C is greatest |
| 10 | 1 | 2 | 50 | C is greatest |
| 11 | 1 | 25 | 1 | B is greatest |
| 12 | 1 | 27 | 2 | B is greatest |
| 13 | 1 | 26 | 25 | B is greatest |
| 14 | 1 | 25 | 49 | C is greatest |
| 15 | 1 | 27 | 50 | C is greatest |
| 16 | 1 | 49 | 1 | B is greatest |
| 17 | 1 | 49 | 2 | B is greatest |
| 18 | 1 | 49 | 25 | B is greatest |
| 19 | 1 | 49 | 49 | B and C |
| 20 | 1 | 49 | 50 | C is greatest |
| 21 | 1 | 50 | 1 | B is greatest |
| 22 | 1 | 50 | 2 | B is greatest |
| 23 | 1 | 50 | 25 | B is greatest |
| 24 | 1 | 50 | 49 | B is greatest |
| 25 | 1 | 50 | 50 | B and C |
| 26 | 2 | 1 | 1 | A is largest |
| 27 | 2 | 1 | 2 | A and C |
| 28 | 2 | 1 | 25 | C is greatest |

| 29 | 2 | 1 | 49 | C is greatest |
|----|---|----|----|---------------------|
| 30 | 2 | 1 | 50 | C is greatest |
| 31 | 2 | 2 | 1 | A and B |
| 32 | 2 | 2 | 2 | All three are equal |
| 33 | 2 | 2 | 25 | C is greatest |
| 34 | 2 | 2 | 49 | C is greatest |
| 35 | 2 | 2 | 50 | C is greatest |
| 36 | 2 | 25 | 1 | B is greatest |
| 37 | 2 | 27 | 2 | B is greatest |
| 38 | 2 | 28 | 25 | B is greatest |
| 39 | 2 | 26 | 49 | C is greatest |
| 40 | 2 | 28 | 50 | C is greatest |
| 41 | 2 | 49 | 1 | B is greatest |
| 42 | 2 | 49 | 2 | B is greatest |
| 43 | 2 | 49 | 25 | B is greatest |
| 44 | 2 | 49 | 49 | B and C |
| 45 | 2 | 49 | 50 | C is greatest |
| 46 | 2 | 50 | 1 | B is greatest |
| 47 | 2 | 50 | 2 | B is greatest |
| 48 | 2 | 50 | 25 | B is greatest |

| 40 | 2 | EO | 40 | D is avantant |
